We begin with a discussion of glass requirements, specifically composition, that enable increased solar energy transmission, which is critical for solar applications.

This work aimed to study the performance of magnesium Oxide Dye-Sensitized Solar Cells (DSSCs). UV/VIS spectrometer was carried out to determine some optical properties of magnesium Oxide ...

The purpose of this work is to study the effect of Mg addition in various concentrations to CZTSSe solar cell absorbers. Mg is incorporated to the absorber thin films by adding a magnesium salt to the ...

A method of making magnesium glass including depositing a film of transparent crystalline MgO on glass at a temperature between 550 \pm 176; C. and 1000 \pm 176; C. by non-sintering, electron-beam evaporation.

The deposition of MgF₂ hollow nanoparticles on the solar cover glass results in OBAR coating and exhibits enhancement of 5.8-31.7% by varying angle of incidence ranging from 10 to 80 ...

This chapter examines the fundamental role of glass materials in photovoltaic (PV) technologies, emphasizing their structural, optical, and spectral conversion properties that enhance ...

Despite the abundance of solar radiation, significant energy losses occur due to scattering, reflection, and thermal dissipation. Glass mitigates these losses by functioning as a ...

This paper is intended to assist both the glass fabricator and end user by providing an overview of the most important properties pertaining to glass used in photovoltaic applications.

The application scope of magnesium in photovoltaic glass continues to expand, addressing critical challenges in solar panel efficiency, weight reduction, and environmental resilience.

In the present work, we use a 5 nm thick amorphous germanium absorber integrated in a magnesium-based
