Can high-temperature data centers save energy?

High-temperature data centers could save large amounts of cooling energy by changing their cooling mechanism. More effective use of "free cooling" is the basic and effective means for high-temperature data centers to reduce cooling energy consumption. It is possible to build chiller-less or even chiller-free data centers.

What are data center cooling solutions?

Learn more about our data center cooling solutions. High-density data centers need IT cooling solutions that can handle high thermal loads, help optimize the use of space, and conserve energy consumption and costs.

Why do data centers need a cooling system?

Data centers have attracted increasing attention worldwide over the last decades due to their high energy consumption. Cooling accounts for about 30-40% of the total energy consumption of data centers. High-temperature data centers could save large amounts of cooling energy by changing their cooling mechanism.

Why do data center operators need server rack cooling units?

These space restrictions mean data center operators need server rack cooling units that are modular in design and flexible in deployment. Plus, data center operators need IT cooling units that can be scaled quickly to minimize the possibility of downtime and maximize computing processes.
