How do wind turbine generators work?

This article ventures into the world of wind turbine generators, exploring how they work, analyzing potential malfunctions and their causes, and offering preventive solutions. Generators in wind turbines convert the motion of wind into electrical energy. When wind blows against the turbine blades, it causes them to rotate around a central hub.

What is a wind turbine generator?

A Wind Turbine Generator is what makes electricity by transforming the mechanical energy into an electrical one. Let's be precise here; they do not make energy or generate more electrical energy than the amount of mechanical power being utilized to move the rotor blades.

What type of electrical system do wind turbines use?

The electrical system most commonly employed for wind turbine applications are those running as generators, with induction generators and synchronous generators being commonly utilized in larger wind turbine generator setups.

How to choose a wind generator?

Based on the installed power, site of turbine, load type, and simplicity of control, the wind generator can be chosen. Squirrel-cage induction or brushless DC (BLDC) generators are usually used for small wind turbines in household applications. Doubly fed induction generators are usually used for megawatt size turbines.
