In 2017, a total of 15,680 MW of wind power was installed, representing 55% of all new power capacity, and the wind power generated 336 TWh of electricity, enough to supply 11.6% of the EU's electricity ...

Wind generates 8.4% of global electricity as a clean energy source. Compare Wind power generation by country with 2024 data and track the low-carbon transition.

Data on renewable power capacity represents the maximum net generating capacity of power plants and other installations that use renewable energy sources to produce electricity.

There was an additional 93 GW of global wind power capacity installed in 2020, the second largest annual increase on record so far. This represented a 56% increase in global capacity ...

These countries demonstrate that the world as a whole can achieve a 40-50% share of wind power in total electricity generation, as outlined by the WWEA in a long-term scenario.

This dataset contains yearly electricity generation, capacity, emissions, imports and demand data for European countries. You can find more about Ember's methodology in this document.

Wind power capacity totals 151 GW, making it the fourth-largest source of electricity generation capacity in the country. This is enough wind power to serve the equivalent of 46 million ...

As of 2023, wind power accounts for 6.59% of global electricity generation, with total global wind power capacity exceeding 743 GW. In the United States, wind contributes 9.2% of the ...

Renewables collectively accounted for one-third of electricity generation, led by hydropower (14% of total electricity generation), wind (8%), solar PV (7%) and bioenergy and waste (3%).

How much wind power accounts for the total power generation

The United States is the second-largest producer of wind power, and generated 341.40 TWh of wind power in 2021, equal to just over 21% of total global production. Together, China and the United ...
