What is a solar PV power plant?

Solar PV power plants consist of several interconnected components, each playing a vital role in converting solar energy into usable electricity. Comprised of photovoltaic cells made of silicon, these panels capture sunlight and initiate the photovoltaic effect.

What is a photovoltaic plant?

A photovoltaic plant is made up of PV modules and an inverter. Photovoltaic panels are responsible for transforming solar radiation. In turn, the inverter converts direct current into alternating current with characteristics similar to the electrical grid. A solar array is a collection of multiple solar panels that generate electricity as a system.

How does a photovoltaic plant work?

This process occurs when photons from sunlight strike a material, typically silicon, and displace electrons, generating a direct current (DC). The acronym "PV" is widely used to represent "photovoltaics," a key technology in renewable energy. A photovoltaic plant is made up of PV modules and an inverter.

Why do we need high resolution satellite images for photovoltaic power stations?

Therefore it is of great significance to monitor the number and distribution of photovoltaic power stations timely and accurately with high-resolution satellite images for the healthy development of photovoltaic industry.
