Can you use solar panels without a battery?

Solar panels generate DC (Direct Current) electricity when exposed to sunlight. The generated DC power can be used directly to power DC appliances or converted to AC (Alternating Current) using an inverter for AC appliances. While using solar panels without a battery has its benefits, it also presents several challenges:

How does a solar system work without battery storage?

Without battery storage, solar systems typically use the utility grid as a battery. Solar energy is first used to directly power your home, and the excess energy is pushed onto the local grid to power neighboring systems. When the solar system is underproducing, the home draws electricity from the local grid.

What happens if a solar panel doesn't have a battery?

Without a battery, there is no backup power, leading to fluctuations in power supply. During cloudy days, early mornings, late evenings, or winter months, the power output of solar panels decreases significantly, limiting the system's effectiveness. Without a battery, excess energy generated during peak sunlight hours is not stored for later use.

How much solar energy can you generate without a battery?

Without the battery and charge controller, the energy cost of the installation also drops from 9,835 MJ to 2,275 MJ. In other words, I could generate at least four times as much solar energy with the same investment in fossil fuels. How can direct solar power be practical?
