-----

To prove its tech is up to the task, Overview completed an airborne demo last month, in which a Cessna Caravan light aircraft transmitted power using a laser to a ground receiver made up of...

Aetherflux, backed by \$50 million in funding, aims to revolutionize renewable energy with space-based solar power transmitted via infrared lasers. The ambitious project could provide ...

There have been proposals to use solar-pumped laser to improve solar-energy conversion efficiently, taking advantage of laser amplification and intra-cavity use of a low-efficiency converter such as PV ...

The beaming of solar power from space back down to earth using lasers sounds like science fiction, and was even floated in an Isaac Asimov short story back in the 1940s. But that is ...

A space solar power system (SSPS) is a next-generation energy technology that converts solar energy into laser light or microwaves on a geostationary satellite orbiting the Earth, ...

The solar-powered laser system being developed under the APACE project could enable power to be sent via satellite, offering new opportunities for space missions.

Discover how seven space power projects plan to beam solar energy from orbit using lasers and wireless transmission.

In 2022, China built a 75-meter-tall ground verification facility to study how to receive wirelessly transmitted solar energy. In 2024, the country also revealed plans to construct a space-based solar ...

New research has found a way to power spacecraft with lasers generated using solar energy alone.

A California-based startup is launching space-based satellites into orbit that will beam solar energy back to Earth using lasers.
