What is a photovoltaic panel?

M.S.M. Nasir A photovoltaic (PV) is known as a device that can convert light energy from the sun into electricity through semiconductor cells[17,18]where the current is produced at a specific fixed voltage which is 0.6 V per cell . A typical panel consists of an array of cells.

How does photovoltaics work?

Photovoltaics operates on the basic principle of photoconversion,where light energy interacts with materials to produce electrical energy. This intricate process starts with the absorption of sunlight by solar cells composed of semiconductor materials,primarily silicon.

What happens when light shines on a photovoltaic cell?

When light shines on a photovoltaic (PV) cell - also called a solar cell - that light may be reflected,absorbed,or pass right through the cell. The PV cell is composed of semiconductor material; the "semi" means that it can conduct electricity better than an insulator but not as well as a good conductor like a metal.

What is a solar cell & a photovoltaic cell?

Solar Cell Definition: A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect.
